Notified Body 1880 – Regulation (EU) no305/2011

TEST REPORT n.1880-CPR-009-001-19

Compliance of dust load to European Regulations (Austrian 15a B-VG,German BIMSchv, French Flamme Verte and Swiss LRV)

Roomheaters fired by solid fuels
UNI EN 13240:2006

Manufacturer: KLOVER SRL
Via A. Volta, 8
37047 SAN BONIFACIO (VR)
Italy

Type designation: ALTEA 110

Type of appliance: Roomheater fired by wood with water heat exchanger.

Receipt date: January 22, 2019

Start test date: January 29, 2019

End test date: February 04, 2019

Testing laboratory: ACTECO SRL
via Amman, 41
33084 Cordenons (PN)
Italy

Issue date: March 25, 2019

Head of Test Laboratory
Dr. Claudia Marcuzzi

Data: 2019.03.25 12:46:17 +01'00'

Task

ACTECO SRL was instructed to execute initial type testing to establish compliance according to the:

- UNI EN 13240:2006 (EN 13240:2001 + EN 13240:2001/A2:2004 + EN 13240:2001/A2:2004/AC:2006 + EN 13240:2001/A2:2004/AC:2007 + EN 13240:2001/AC:2006). Roomheaters fired by solid fuels.
- UNI CEN/TS 15883:2009 Residential solid fuel burning appliances. Emission test methods
- Client's documents

The practical tests were performed in the laboratory in Cordenons (PN), via Amman, 41.

Sampling of the appliance

The sampling of the appliance was performed by the manufacturer and was received by the testing laboratory on January 22, 2019.

Description of the appliance

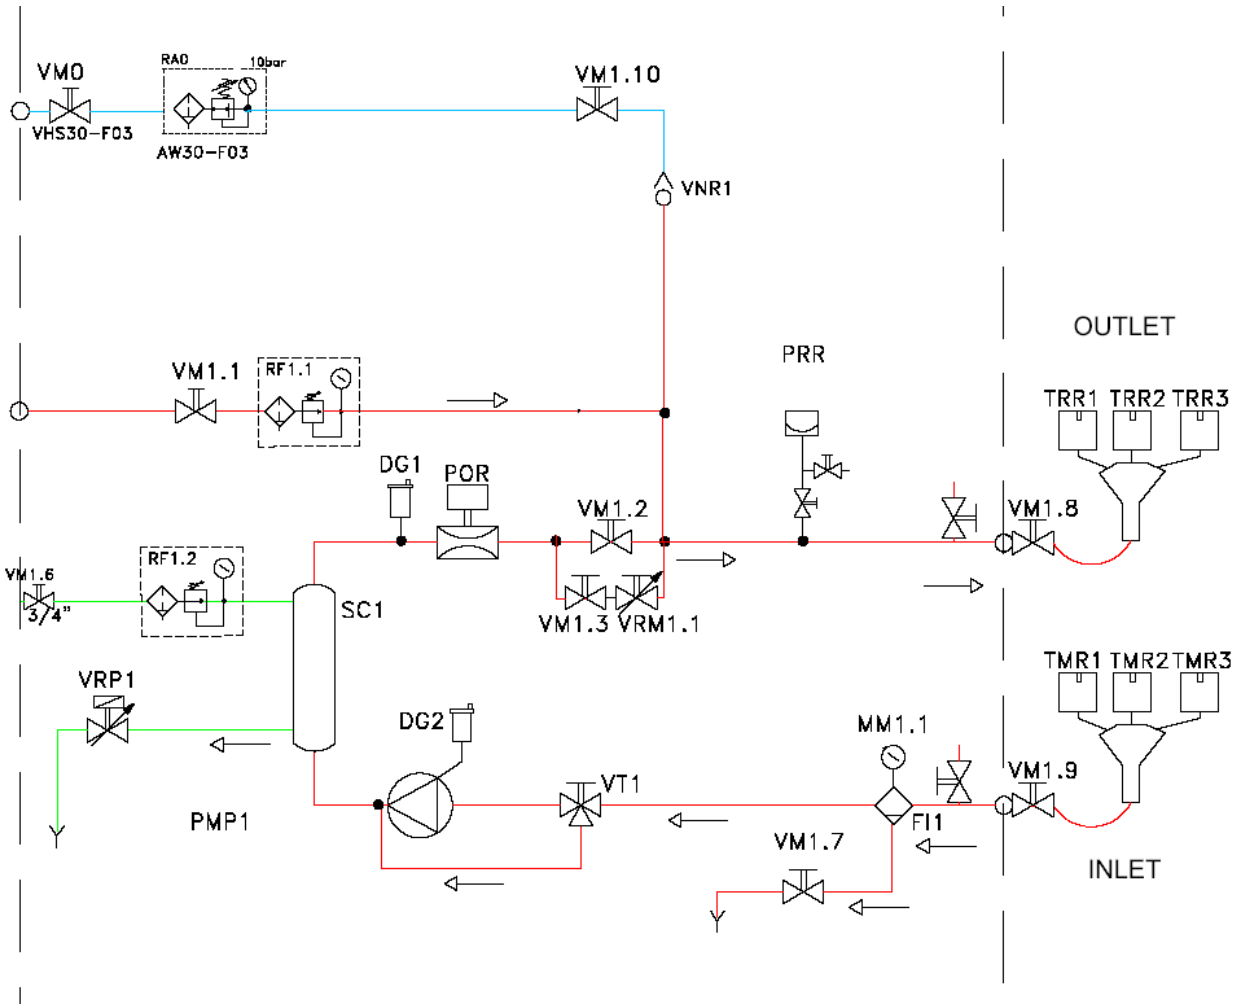
Residential space heating appliances fired by wood with direct and indirect water system.
The combustion air is taken from the test room.

Key data of appliance

Appliance	ALTEA 110		
Fuel		wood logs	
Fuel throughput	kg/h	3,8	
Total heating output	kW	14,7	
Space heating output	kW	6,9	
Water heating output	kW	7,8	
CO emission based on 13% O_2	mg/m³	816	
Efficiency	%	89,4	
Flue gas temperature	°C	131	
Necessary flue draught	Pa	9,4	
Flue gas mass flow	g/s	11,7	
Permissible maximum operating pressure	bar	2,5	
Minimum clearance distances from exposed / combustible materials	from rear wall from side walls		10 mm iso 0 mm

Description of the water circuit used for the water heating output test

The water circuit used for the water heating output test was a closed circuit as shown in the figure below.
The outlet temperature was set to 80°C ±5°C and the water flow was set to a constant flow according to the expected boiler heat output.
During the test period, inlet and outlet temperatures and the water flow were measured at 10 second intervals. At the end of the test period, the mean rise in water temperature between boiler inlet and outlet and the mean water flow were calculated.

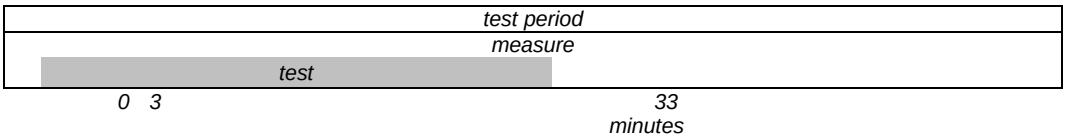


Description of the dust emission test

Measurement of particulate emissions is performed with UNI CEN/TS 15883:2009 (equivalent to VDI 2066:2006 part 1) parallel to CO-measurement during the initial type testing according to the nominal heat output test described in UNI EN 13240:2006 A.4.7.
A sample flow of the gas is extracted from the main gas flow at a representative sampling point for the sampling period with a controlled flow rate and the withdrawn volume is measured. The dust entrained in the gas sample is separated by a pre-weighted plain quartz fibre filter, which is dried an re-weighted. The increase of mass of the filter is attributed to the dust collected from the sampled gas.

The measurement position for particle measurement is arranged downstream of measurement positions of CO, CO_2, NOx and OGC (Organic Gaseous Compounds). Measurement of particulate emissions and duration of measurements are described in the following scheme.

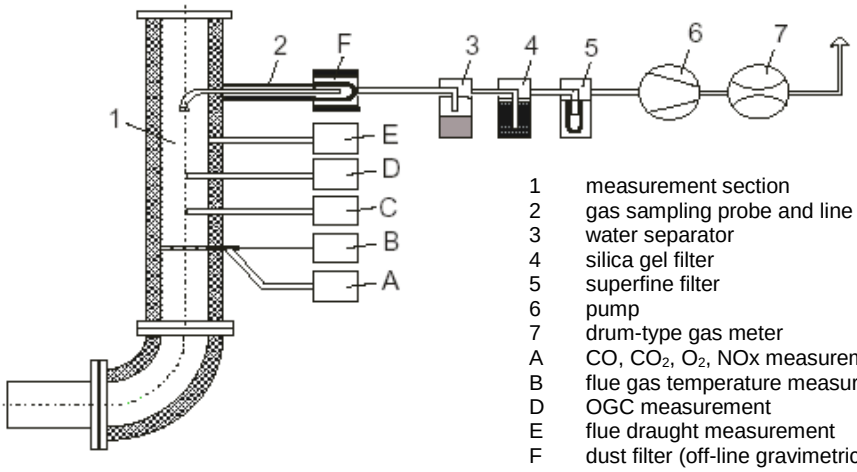
nominal heat output test:



The measuring arrangement is illustrated in the following figure. The sampling tube widens out to 9,74 mm at the specimen inlet. In a sampling period of 30 minutes a waste gas volume of 270 ± 13,5 l relative to normal conditions (273 K, 1013 hPa) is sampled, corresponding to a flow rate of 10,0 ± 0.45 l/min.

Note: In the interests of simplifying the measuring method, individual measurement of the flow velocity and subsequent matching of the inlet cross-section are dispensed with. In order to carry out the measurement, the sampling probe is centred in the exhaust-gas cross-section..

The measuring filter is inserted in a filter holder at the end of the sampling probe and a controlled probe heating system is adopted to exclude the possibility of the sampled flue gas falling below the dew point in front of or in the filter sleeve.



1	measurement section
2	gas sampling probe and line for dust measurement (heat insulated)
3	water separator
4	silica gel filter
5	superfine filter
6	pump
7	drum-type gas meter
A	CO, CO_2, O_2, NOx measurement
B	flue gas temperature measurement
D	OGC measurement

STATEMENTS OF THE TEST RESULTS

The requirements for CO, NOx, OGC and dust emissions and for efficiency of Austrian 15a B-VG, German BIMSchv, French Flamme Verte and Swiss LRV for appliances hand fired by wood are the following.

Austrian 15a B-VG (reduced heat output is not applicable for appliances with nominal heat <8kW)

Nominal heat power	
	[mg/MJ]
CO	1100
NOx	150
OGC	50
dust	35
efficiency	80

Reduced heat power	
	[mg/MJ]
CO	1100
OGC	50
efficiency	80

German BIMSchv limits (at 13% O_2)

CO [mg/m^3]	dust [mg/m^3]	efficiency [%]
1250	40	75

Swiss LRV limits (at 13% O_2)

CO [mg/m^3]	dust [mg/m^3]
1500	75

French Flamme Verte limits (at 13% O_2)

stars	CO [mg/m^3]	dust [mg/m^3]	efficiency [%]	NOx [mg/m^3]
6	1875	50	75	200
7	1500	40	75	200

The appliance **ALTEA 110 of KLOVER SRL** fulfils the requirements of

- German BIMSchv
- Swiss LRV limits
- Flamme Verte (7 stars).

MEASURING DEVICES

The requirements of the measuring instruments are fulfilled.
Before each qualified measuring analysers were calibrated with zero gas and calibration gas.

Parameter measured	principle	Company	range	uncertainty	Calibration gas
O_2	paramagnetic	Horiba	0 – 21%	±0.1%	0 – 2,5 – 9,0- - 21%
